

# Freeway

## Introduction for SIM activation and initial subscription booking

Company **FREEWAY** (<https://freeway.com>) is a "virtual" mobile network operator (co-called "MVNO"). Freeway has been selected as a network partner mainly because of their excellent network coverage which is based on the utilization of multiple local network infrastructures - instead of just one. This is particularly beneficial for **mobile P2M\* installations or a deployment in challenging target environments.**

### SIM Activation

According to EU legislation, mobile network operators are not allowed to activate a SIM card without prior identification of their customer resp. owner of the SIM card. This rule applies to all kind of transmitted data, and affects all network users, just to phone users. The associated procedure is called **SIM card**

## registration.

Practically, a new owner of a **P2M\*DIO8** module will have to connect to the Freeway SIM portal at <https://my.freeway.com> resp. use the QR code printed on **P2M\*DIO8** product label.

Please follow instructions provided by Freeway portal which will guide you through the whole process.

User registration itself will be simple and straight-forward and can be done online in a few minutes using photos of the national ID card and a short video sequence. No personal interaction is required.

## Book a SMS Package

Once the identification has been finished, the Freeway portal will allow you to book your first data package containing transmission fees for a predefined number of SMS messages to be send by the associated **P2M\*DIO8** module. Several prepaid SMS credits are offered - tailored to different **P2M\*** project lifecycles and corresponding demands.

Keep in mind that connecting to the network is free of charge. This means that any **P2M\***-enabled object can stay online without generating any cost to the owner of the device resp. the owner of the installed SIM card.

On top of this, submitting an SMS command to a **P2M\***-module (typically) will be charged to the sender of the SMS message only. This means that your **P2M\***-SIM will be charged only in case of **P2M\***-originated SMS messages (e.g. the response SMS which is triggered by a **stat?** command (refer to section "SMS\_Command\_List" of the **P2M\* Manual**). On the other hand, switching a remote device on or off does not impact

booked SMS credit for the embedded SIM card. Conclusion: Booking of a small initial SMS package might be a good idea - as a starting point.

These are most recommended choices:
